

CLEANING AND CARE MAINTENANCE FOR STAINLESS MATERIAL

Below is a suggested method of cleaning and care for JAG Metal Solution stainless products.

Select a cleaning solution that is tailored to stainless steel. Ex. Sheila Shine. Please steer clear from using any acidic solutions that are not made for such applications. Such solutions may corrode the finish of the stainless steel.

Use a soft cloth, such as microfiber, to clean the surface of the product. Do not use abrasive materials on the product. Such materials may scratch and damage the stainless steel. When rubbing the stainless, make sure you rub with the grain of the stainless. Do not go in a circular motion.

Repeat until dirt is removed and surface is clean.

In areas where the product is exposed to heavy pollutants or salt spray, such as but not limited to coastal areas, cleaning should take place on a minimum once per month basis. Cleaning and maintenance should be part of a regular maintenance program.
